

Benefits:

Border control officers responsible for Homeland Security are among the largest users of video analytics for detecting intrusion at perimeter fences, tracking suspicious persons, and recognizing criminals.

More Effective - Under the cloak of darkness, intruders try to infiltrate borders, buildings and security infrastructures. Thermal imaging and night vision may eliminate surprise at night, but with large areas sometimes security systems falter. Combining existing CCTV or thermal imagery with advanced, intelligent video analytics, security officers can comb swaths of land with more effectiveness.

Cost-effective and Proactive - The camera, with its intelligent processing, can track suspicious individuals in the field without overwhelming security personnel monitoring the activity. Additionally, with the ability to track their path of movement, security personnel can maneuver into the area and take action.

Features:

iSAFE IVR Video Analytics functions:

- Loitering Detection
- Intrusion Detection
- Tampering Detection of security cameras
- Human Detection and Tracking
- Black List Filter to alert against unwelcome people
- Facial Recognition system for border control
- Behavior Recognition for hold-up, running, wrong way, etc.
